Customized shaping of the platform with laser cutting

PLYWOOD FLOOR

The brand new SMDM FADIEL decks, made entirely in our production facilities, are made of durable Birch plywood with a thickness of 12 mm worked with fire-retardant glues.

The platform is elegantly finished in the easy-to-clean surface made of linoleum-like material, resistant to wear over time and with non-slip properties.

It is fixed using the original threaded holes already present in the car, without having to make additional holes.

They are available tailored for a wide range of vehicles on the market.

ANCHORING SYSTEMS

The anchoring systems for wheelchairs can be installed with a coupling mechanism on the floor rail or with a disk system. The reels are completely automatic and equipped with a knob for manual tensioning after positioning the wheelchair.

The coupling to the wheelchair is done with hooks with rubber protection to prevent damage to the wheelchair during transport. It is a system compatible with all types of wheelchairs, electric, push and self-propulsion, it guarantees maximum stability and retention allowing a quick dismantling thanks to the practical and fast release system.

In the kit is also included the ventral safety belt for the transported passenger. On request we can supply seat belts for passengers carried at 3 and 4 points.
